ANALYSIS OF AN INTERSECTION
‘DHARMARAJ CHOWK’

Abstract: Study of intersection is very important to control traffic flow, factors contributing to traffic accidents are numerous and they interact complexly. The occurrence of traffic conflict is determined. This study proposes methods of investigating and analysing data. Detailed accident analysis shows that intersection scenarios are a serious focal point for accidents in urban areas. Therefore such an analysis is necessary to be done. There exist a lot of different intersection types with different levels of complexity. Therefore, the relevant scenarios were chosen out of the accident analysis to focus only on the most dangerous scenarios. Pedestrian road crossings have become a major issue in road traffic flow, especially in urban areas where there is no control for pedestrian road crossings. Pedestrian road crossing behaviour is a serious threat to pedestrians at uncontrolled midblock crossing locations in the mixed traffic conditions. Due to increase in motor vehicle growth there is an increase in the regulation of motor vehicles only and the regulation of pedestrian is completely neglected. This increases the uncontrolled road crossing behaviour of pedestrian. The main motivation of this study is to investigate the errors in the design of intersection so as per our interest we choose ‘Dharmaraj chowk’ Akurdi.

As number of accidents are increasing day by day, during the decade 2001 to 2011, the number of road accidents in the country are increased at a compound annual growth rate (CAGR) of 2.1 per cent. Similarly, the number of road accident fatalities and the number of persons injured in road accidents in the country between 2001 and 2011 increased by 5.8 per cent and 2.4 per cent, respectively. As a result of concerted and coordinated road safety efforts there has been a decline of the order 3.1 per cent and 0.4 per cent in the number of persons injured and the number of road accidents, respectively, in 2011, compared to 2010. However, the number of fatalities increased by 5.9 per cent in 2011.

IndexTerms - Pedestrian Survey, traffic survey, traffic problems.

I. Introduction

Intersections play a important role in the road network, where traffic flows in different directions converge. Because of their influence disturbance of pedestrians and bicycle to vehicles, and the lost of green time for beginning and clearance and so on the capacity of intersections is much lower than that of their approach links. Thus, the intersections usually are the bottleneck of the network, the popular and immediate source of the traffic jam and traffic accidents. Thus, it is significant to study the traffic flow characteristics at signalized intersections in the developed country and the developing country, because capacity of the intersection can be improved according to their Characteristics. Study on traffic flow characteristics at signalized intersections is one of most effective and immediate measure to enhance the capacity of road networks and relieve the congestion in cities.

In India, 15 people die and 60 are seriously injured or disabled every hour in road accidents. Every year more than 1.17 million people die in road accidents around the world. The majority of these deaths, about 70 percent occur in developing countries. Sixty-five percent of deaths involve pedestrians and 35 percent of pedestrian deaths are children. Over 10 million are crippled or injured each year. It has been estimated that at least 6 million more will die and 60 million will be injured during the next 10 years in developing countries unless urgent action is taken. Road accidents not only impose huge economic losses representing between 1-3% of annual Gross Domestic Product in most countries but also causes great emotional and financial stress to the millions of families affected. The continued steep increase in the number of road accidents indicates that these losses are undoubtedly inhibiting the economic and social development of the countries and adding to the poverty and hardships of the poor. Thus, there is an urgent need to improve safety of the roadway and its adjacent development. Considering this importance of improving road safety. The trends of road accidents and huge socio-economic losses shows that there is an urgent.

II. Problem statement

This study was conducted to analyse and evaluate the performance of unsignalised intersection. Akurdi is one the key urban area in PCMC because the population in the area is above 3 lakh. At newly renovated intersection of ‘Dharmaraj chowk’ near Akurdi railway station, on D.Y. Patil road which is major road that connects to the express way so the traffic is more, there is two under passes designed, near the intersection engineering colleges on both side of railway line are located. And, the vehicles travelling on road have no safety measures while turning on crossing intersection. And road is having bigger traffic jams and the number of conflicts is increasing day by day. The unsignalised intersection was identified as two way stop controlled unsignalised intersection (TWSC) where the traffic flow was controlled by stop rule. For a TWSC intersection, the stop control approach are referred to as the major road approaches. So analysis of the intersection in terms of design and other aspects is necessary to have a fluent flow of traffic, and this analysis is also important to overcome traffic accidents, conflicts by properly designing the intersection.
III. Objective

Each accident calls for systematic study in scientific manner and detailed investigation of the accident spot. This type of investigation will help to identify some of the causative factors responsible for accidents and to give relative importance. The results of the study could be employed advantageously to take up preventive measures to reduce the accidents.

The objectives of the present study are:

- To analyse the conflicts at intersection
- To Study the effect of roadway geometrics and traffic conditions on this stretch.
- Study of Road Safety Audit.
- Traffic Survey.
- Identifying the problem at intersection.
- Suggestion for safe road travel.

IV. Scope of project work

Prepare existing road safety audit in order to rectify safety and utility need. It recognizes that a roadway may change over time. Changes may have resulted from changing road use, encroachments, and design inconsistency, ageing infrastructure and inadequate maintenance of road and traffic control devices and other measures. Points to be emphasized are adequacy of roadway, roadside and intersections, interchanges, grade separators, location of bus stops, needs of VRU, access management.

- The accidents on road network can be reduced.
- The severity of accidents can be reduced.
- The need for costly remedial work is reduced.

V. Methodology

- Geometric study of intersection

In this we have studied the geometry of intersection. Such as width of lane, width of footpath, study of island, sight distance and AMF.

\[
AMF = \frac{1.55L_c + \frac{80.2}{R} - .012S}{1.55L_c}
\]

where

- AMF = Accident modification factor, a multiplier that describes how many more crashes are likely to occur on the curve compared to a straight road
- \(L_c\) = Length of the horizontal curve in miles
- \(R\) = Radius of the curve in feet.
- \(S\) = 1 if spiral transition curves are present
  = 0 if spiral transition curves are absent

- Traffic volume study at intersection.

To study count of vehicles passing through the intersection at particular points, on specific day, at specific time.

- CONFLICT POINT ANALYSIS

Based on the traffic flow and the geometry of intersection conflict point can be decided.

- COMPARISION WITH STANDARD VALUES GIVEN BY IRC

Based on the survey conducted values obtained will be considered with the standard values of design given by IRC.

- DESIGN ANALYSIS

Analysis of design of intersection and its properties.
• ALTERNATE DESIGN SOLUTIONS
Based on the analysis if there is any error in design correction and alternative measure can be provided.

• CONCLUSION
Based on the study results, preventive measure and solutions are given.

CONCLUSION

VI. Limitations of study

In spite of the several advantages mentioned in this study, there are many limitations some of these are listed below.

1. There might be an error in traffic volume survey.
2. There can be error in calculation.
3. Exact data from municipality is not available.
4. Alternatives proposed by this survey might be costly.

VII. Expected outcomes

1) Points of conflict will be known.
2) Error in design can be identified.
3) Reasons of Traffic jam can be known.
4) Number of accidents will be reduced.
5) Requirement of signals can be identified.
1 At Glance

We made a team of four, consulted Mrs. Aavni Thampi and discussed about the project. She gave us a brief idea about the project. Our project was to analyse an intersection. We had visiting many nearby instructions in PCMC, we had visited kiwale chowk, Gurudwara chowk, Jagtap dairy chowk, Bhondawe chowk. After that with the help of our guide Mr. Rohit Shinde, we selected Dharmaraj chowk for study.

2 Research

Next step of our project was research. So after searching 10 to 15 research papers of National and International journals, we collected all the information regarding the intersection such that types of intersection, rules by IRC for the intersection, consulting Mrs. Aavni Thampi who is expert in transportation engineering as well as our co-guide. And some information was collected from Wikipedia and Google.

3 Geometric study

Next step was requirement of field study so with the permission of our guide we collected required instruments from our department and went to the field for actual calculation of field properties, we measured the following data:

- Width of carriage way = 7.5 m
- Width of footpath= 1.5 m
- Height of kerb=100mm
- Design speed=60kmph

4 Traffic study

After the geometric study our next step was the traffic flow study of intersection so we decided a day and did the traffic study on specific day at peak hours and normal hours. We counted the vehicles on each lane at particular point and categorised them as car, motor, bus, bike, LCV, HGV and other.

5 Pedestrian Survey

We performed pedestrians survey in 2 shifts that is morning peak hours and evening peak hours, as there are engineering colleges on both sides of the tunnel pedestrians are more mostly the college students so there safety is a major issue so this survey becomes very important.
Pedestrians are unsafe while crossing the intersection, insufficient width of footpath on both lanes of road, required more time for crossing. A questionnaire based survey was carried out for suggestions and short comes for pedestrian crossing at junction. Based on surveys, and analysing with Road Safety Audit and IRC recommendation. Table no 1 show the values of PCU with standard as per road design. Table clearly shows the traffic on road is about thrice the capacity of design. The pedestrians route are insufficient need to be widen.

6 Analytic survey of road

In this survey we analysed the roads for-
Availability of lights-There is no provision of lights on the road.
Provision of zebra crossing- no zebra crossings are provided on the road.
No pedestrian signals, no lane marking, pavement structure is in good condition, and no traffic signs.

7 Obtained Data

<table>
<thead>
<tr>
<th>Description</th>
<th>Recommended values by IS code</th>
<th>Present value</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Volume PCU (Morning Peak Hour)</td>
<td>1200</td>
<td>7485.5</td>
<td>Unsafe</td>
</tr>
<tr>
<td>Traffic Volume PCU (Evening Peak hours)</td>
<td>1200</td>
<td>9637.6</td>
<td>Unsafe</td>
</tr>
<tr>
<td>Pedestrians volume (Morning peak hours)</td>
<td>800</td>
<td>1500</td>
<td>Should increase width of footpath up to 2m</td>
</tr>
<tr>
<td>Pedestrians volume (Evening peak hours)</td>
<td>800</td>
<td>1800</td>
<td>Should increase width of footpath up to 2m</td>
</tr>
</tbody>
</table>

Table no 1

IX. Partial Conclusion

- There might be error in design of island on intersection.
- As per the survey traffic flow is huge.
- For Reducing the risk of accidents occurring in the future as a result of renovation of roads will be minimize by RSA.
- Safety of roads and pedestrians should be mandatory point while designing, renovating, extending the roads.
- Lack of pedestrian signals. Improper pavement structures. Disturbance to outer lane due to unauthorized ramp on the road.
- Lighting problems at night.
